Among discussions at the intersection of science and Christian faith, perhaps the most contentious subject in recent years is the historicity of Adam and Eve. On the scientific side, genetic and fossil evidence weigh heavily against humanity starting as a specially created, individual man and woman. Fossil hominid remains make a strong case for human lineage that derives from nonhuman ancestors, and genetic variability in the human genome appears to require that the earliest Homo sapiens population never dropped below several thousand members. Theological Anthropology (Sources of Early Christian Thought) by Patout J. Burns Paperback $21.87. In Stock. Ships from and sold by Amazon.com. Norris' brief volume is still the best introduction to the Christological Councils and the summary of mainstream Christian Christology. What is professed in the Nicene Creed developed over time through deep discussion, prayer and discernment (and apparently a few brawls among bishops!) and is presented here in a single volume that is of great value to students of theology and Christian history.
