The Progressive Nature Of Renal Disease

William E Mitch

Conclusion: Complexity and chronic nature of the disease affect the quality of life of patients with CRF and their health and reduce their life expectancy. So, the role of the Nephrology Nurse is highly important for the implementation of effective nursing interventions and psychological support during their treatment. Chronic Renal Failure (CRF) is an irreversible and progressive kidney failure where body fails to maintain metabolic and electrolytic balance, resulting in uremia, metabolic acidosis, anemia, electrolyte imbalances and endocrine disorders. Its main causes are diabetes, hypertension, glomerulonephritis, and polycystic kidney disease.
