Biochemical methods are used in all branches of biological sciences and agriculture. The biochemistry utilizes in practice a whole series of methods and laboratory techniques to identify the quantitative and qualitative analysis of biochemical processes. Main areas are the characterization, isolation, purification and of biomolecules, structure determination, analytical and test methods. Biochemical methods are mostly commonly applicable in the field of Membranes and membrane proteins, Molecular genetics, Novel methods of protein purification, Immunological techniques applicable to biochemistry... Methods: All cases of confirmed hypoglycaemia, referred during a six month period, were included in the survey. Questionnaires were sent to each referring laboratory requesting information on the clinical. For reasons of clinical interpretation of the biochemical data, the patients with hypoglycaemia were divided into neonates.

Abbreviations: IKHH, idiopathic ketotic hypoinsulinaemic. Blood insulin and C-peptide are key investigations in the differential diagnosis of hypoglycaemia. Analogues of insulin have modified primary-sequences compared to native human insulin, as such may not cross react with insulin assays. This has important implications in detecting surreptitious or malicious insulin administration.
