Structured Design is more suitable for offshoring. It is suitable for real time system, embedded system and projects where objects are not the most useful level of abstraction. It is suitable for most business applications, game development projects, which are expected to customize or extended. Object-Oriented Design. The objective of this phase is to design and refine the classes, attributes, methods, and structures that are identified during the analysis phase, user interface, and data access. This phase also identifies and defines the additional classes or objects that support implementation of the requirement.
